HRPD Complete Edit Reduction Variables
Chipir Error Edit Reduction Variables
1 Editing of reduction variables is restricted to the relevant instrument scientist and administrators.
2 Admin could simply use the django database administration panel to manage instrument scientists associated instruments.
3 Filter the displayed results below using a fuzzy matching search for instrument, RB and run number.
4 Notifications to alert user to failed reduction runs relevant to them. Could also be used to display system-wide notification should as planned downtime.
5 When a run is re-run it is highlighted with an astrix (*) and the run number is appended with an incrementing number

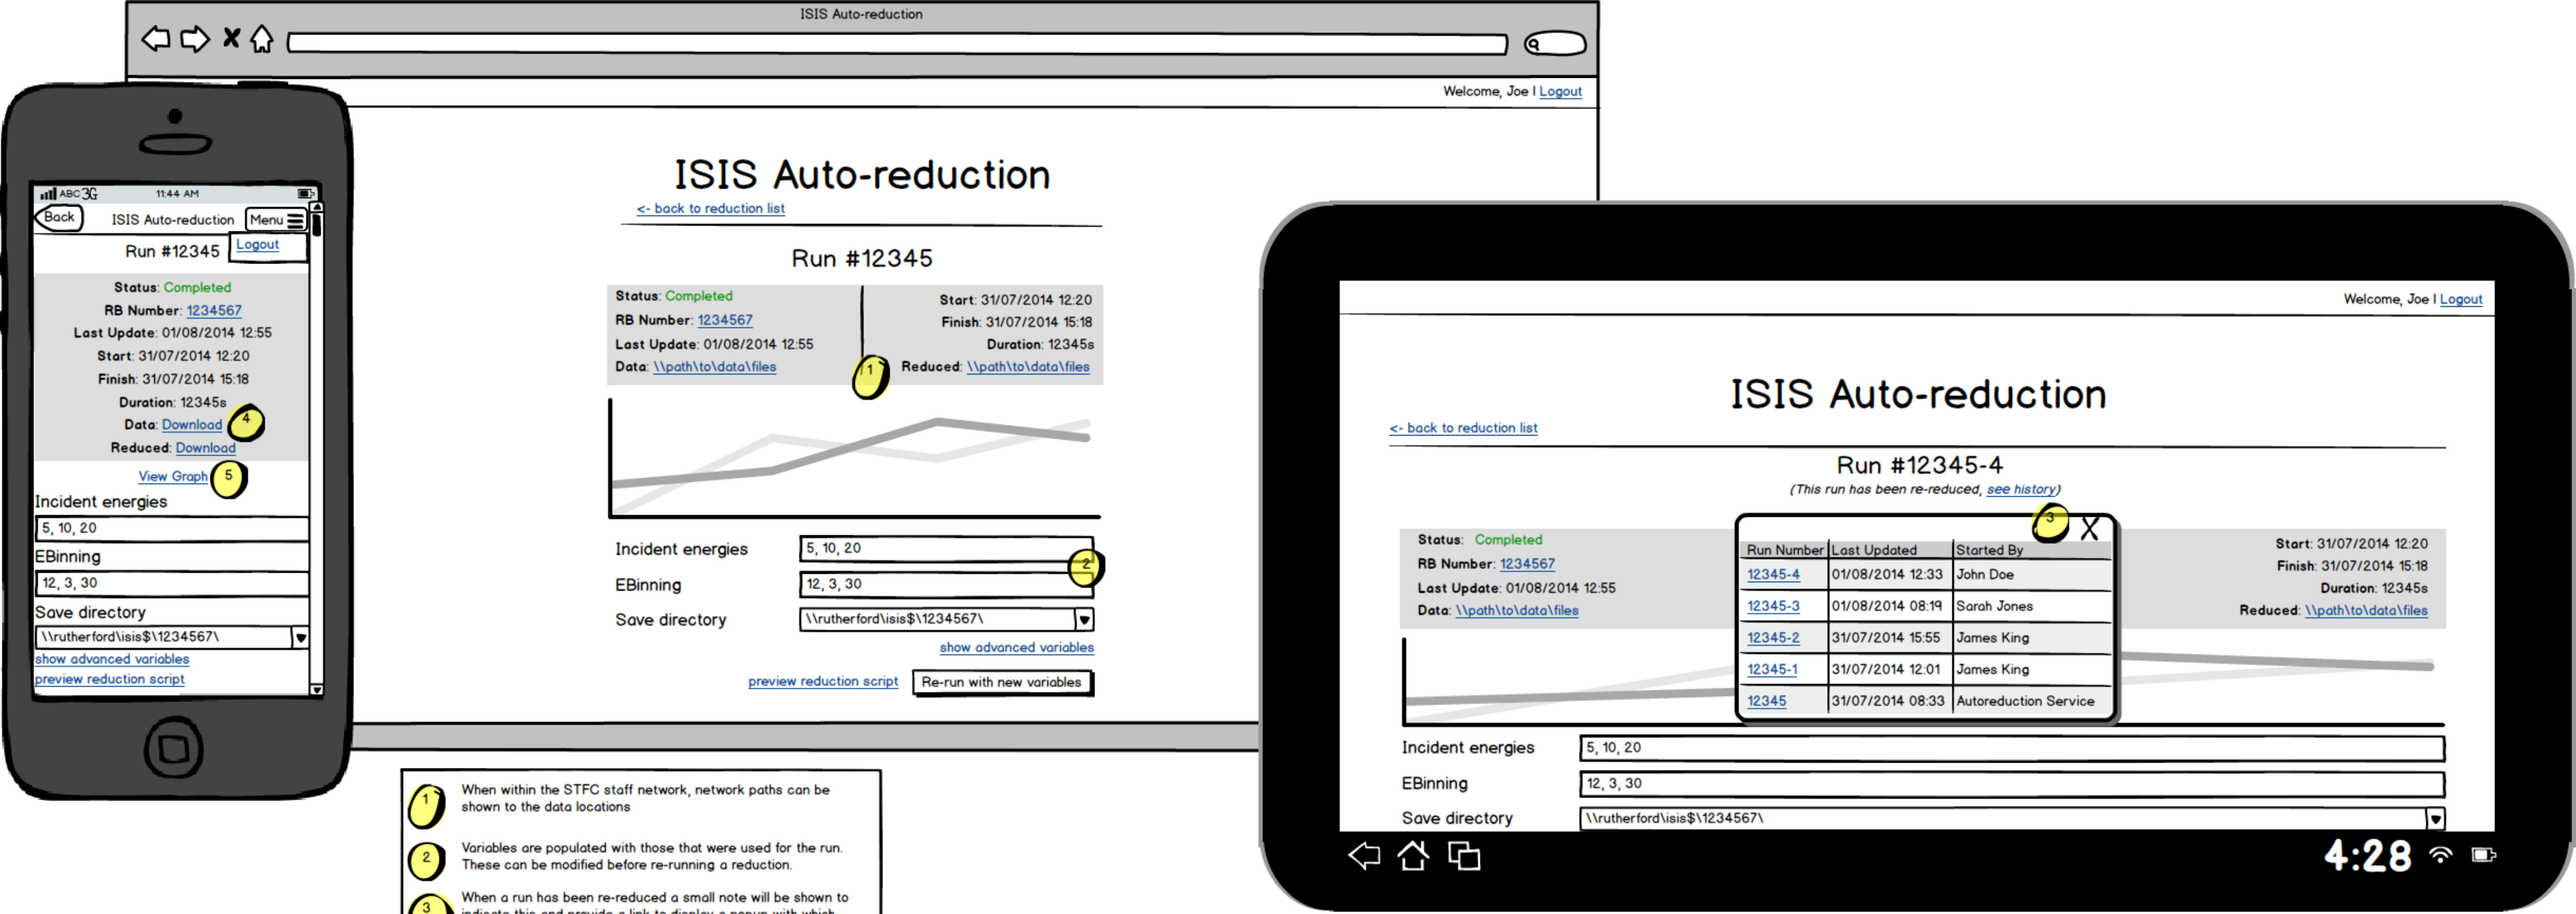
Show the current status of reduction on that instrument to help users decide when variables need to come into effect
Attempt to pre-populate variables
Provide a list of available output locations (based on experiment etc.)
Generate a python file with the variables updated for the user to check its correct



1. When within the STFC staff network, network paths can be shown to the data locations
2. Variables are populated with those that were used for the run. These can be modified before re-running a reduction.
3. When a run has been re-reduced a small note will be shown to indicate this and provide a link to display a popup with which different versions of the run can be selected.
4. When outside the STFC staff network an ICAT download URL will be used.
5. Graph image opens in a new window on mobile to allow it to be viewed using the phone's image app
